MeteoGroup Services for Business

MeteoGroup

Europe's largest independent weather service provider

Accurate site specific weather forecasting - for power producers worldwide

Weather Forecasting Services

the best production forecasts require the best weather forecasts

Local weather conditions play an important role in the potential production capacity of power plants such as CCGTs and CHPs. To assist with the decision making process, detailed site specific forecasts that are updated daily, three hourly or even hourly can be delivered directly to your system from MeteoGroup.

Our forecasting technique draws on thousands of global observation sites to provide comprehensive coverage of key locations for your business. These individually tailored forecasts are sent directly via FTP or e-mail and can be updated as often as required. Enhanced services using historical site data are also available for increased forecast accuracy. This method uses regression analysis to introduce a bias that links your individual location to MeteoGroup forecast sites.

Site specific forecasts can be further refined through the continuous monitoring of on site weather conditions. A direct data feed to our development centre ensures MeteoGroup delivers the most detailed and accurate forecasts available.

PowerCast at a glance

built around client requirements MeteoGroup's PowerCast service includes:
